Fueling Security Meets Homeland Security for the System2™ and K800™ Fuel Control Systems.

Advanced security is now available for your unattended fueling operation with Petro Vend's proximity reader option. When installed in your K800 or C/OPT™ Fuel Island Terminal, fueling access is either granted or denied a cardholder when their proximity card (containing an internal antenna) is waved within a few inches of the reader. Petro Vend's proximity readers are durable and work with most existing proximity cards*.

Features

- Reads most existing proximity card formats, so employees can use the same cards they already carry for building access*

- Cards or keys can also be conveniently obtained from OPW Fuel Management Systems

- With the C/OPT's dual reader capability, proximity cards can be used in addition to mag-stripe cards or ChipKeys® for extra access flexibility

- A "2-card system" combining an employee proximity card with a vehicle key may be used for added security

- There are no moving parts or physical contact between the proximity cards and the reader making it maintenance-free and extremely reliable

- Proximity card verification is the most secure and reliable driver or vehicle identification method available today
